The first five books listed

) are

the only ones which the Soviets recommend for use in their educa-

tional institutions. Compilation by the Central Bureau of Technical Information -Collection of Radio Technical Problems, 1947

This book, edited annually, is a collection of radio technical developments discovered and analyzed during the year.

- Kubarkin and Enutin, How to Build a Detector Receiver, 1948 Written for use in constructing a primitive detector radio receiver without tubes.
- Sutiyagin, V. Ya., Amateur Television Receivers, 1952

This book includes a description of how to construct a television receiver using the frequency for channel 1 (49.75 mc for picture and 56.25 for voice). The operation is based on a minimum of tubes and for a distance of not more than 15 or 20 kilometers from the trans-mitting station. This receiver does not utilize an intermediate frequency. The recommended screen radius for the kinescope circular tube is nine inches.

- Weinstein, S S, and Konashinsky, S A, Lessons and Examples for Radio Amateurs, 1951
- How to Build Your Own Amateur Television Trans-Vovchenko, V. S. mitter Station, 1951

As stated in this book, television frequencies have been designated for use by amateurs. (It is of interest that the Soviets encourage television amateurs but not radio amateurs. Apparently, they reason that the medium of television is more desirable since it is more controllable. Conceivably, radio amateurs could be exposed to propaganda from all over the world. However, radio liferature is disseminated and its reading is encouraged by the Soviets so that, in the event of hostilities, many would be prepared to work in a factory producing electronic againment.) This book includes a description of how a group of television amateurs could operate the station located in Kharkov, USSR, and how any group could build such a transmitting station in any city. The designated frequencies could then be assigned for their use. These frequencies as described on page ten of this book are:

Channel 1 49.75 mc for the picture; 56.25 mc for voice Channel 2 59.25 me for the picture; 65.75 me for voice Channel 3 77.25 mc for the picture; 83.75 mc for voice

The described frequencies are presently in use in Moscow, Leningrad, Kiev, and Kharkov. . The following television receivers are made for operation on these frequencies:

Description Receiver

T-1 Made for channel 1 Moskvich, Leningrad, T-1 Made for channel 1

SECRET -3-

Receiver

Description

KVN-49-4

Made for channels 1, 2, and 3; this is the latest type (a description appears in the Soviet magazine Radio, Issue No 4, April 1952).

Leningrad, T-2 A receiver made for channels 1, 2, and 3; this is the most sensitive type.

The Soviets encourage the use of Moskvich and Leningrad receivers because these types are more available on the market.

amateur groups may have built other stations. The amateur group at the army school at Odessa, USSR, purchased two "Tonne" cameras in order to set up a television transmitting station.
